# Degree & Education Mapping

Simple API explanation for frontend and backend developers

> There is no separate Degree–Education Mapping controller. A degree is connected to an education level by saving the education level's ID in the Degree record as `levelOfEduId`.

## 1. APIs used by the screen

| Purpose | API |
|---|---|
| Load the Education Level dropdown | `GET /api/v1/level-of-educations` |
| Load all degrees | `GET /api/v1/degrees` |
| Load degrees for one Education Level | `GET /api/v1/degrees?levelOfEduId={levelId}` |
| Create a degree mapping | `POST /api/v1/degrees` |
| View one degree | `GET /api/v1/degrees/{id}` |
| Update one degree | `PUT /api/v1/degrees/{id}` |
| Delete one degree | `DELETE /api/v1/degrees/{id}` |

## 2. How the mapping works

1. The frontend loads the available Education Levels.
2. The user selects an Education Level, such as “Bachelor”.
3. The frontend sends that level's ID as `levelOfEduId` when saving the degree.
4. The backend stores the Degree and its relationship to the selected Education Level in the same Degree record.

## 3. Example create request

```
POST /api/v1/degrees
Content-Type: application/json

{
  "levelOfEduId": 1,
  "degreeName": "Bachelor of Science",
  "shortName": "BSc",
  "sortOrder": 1,
  "status": 1
}
```

## 4. Important scope limitation

The current Swagger contracts for Education Level and Degree do not contain `bgId` or `buId`. Therefore, these records are currently global and cannot be filtered by the logged-in user's Business Unit.

Prepared from the current Swagger contract on 3 November 2026.
